Question **1**

Correct

240701072

Marked out of 1.00

Flag question

Given an array of integers, reverse the given array in place using an index and loop rather than a built-in function.

Example

arr = [1, 3, 2, 4, 5]

Return the array *[5, 4, 2, 3, 1]* which is the reverse of the input array.

Function Description

Complete the function *reverseArray* in the editor below.

reverseArray has the following parameter(s):

int arr[n]: an array of integers

Return

int[n]: the array in reverse order

Constraints

$1 \le n \le 100$

$0 < arr[i] \le 100$

Input Format For Custom Testing

The first line contains an integer, *n*, the number of elements in *arr*.

Each line *i* of the *n* subsequent lines (where $0 \le i < n$) contains an integer, *arr[i]*.

Sample Case 0

Sample Input For Custom Testing

5

1

3

2

4

5

240701072

Sample Output

5

4

2

3

1

Explanation

The input array is [1, 3, 2, 4, 5], so the reverse of the input array is [5, 4, 2, 3, 1].

Sample Case 1

Sample Input For Custom Testing

4

17

10

21

45

240701072

Sample Output

45

21

10

17

Explanation

The input array is [17, 10, 21, 45], so the reverse of the input array is [45, 21, 10, 17].

Answer: (penalty regime: 0 %)

Reset answer

```
/*
 * Complete the 'reverseArray
 *
 * The function is expected t
 * The function accepts INTEC
 */

/*
 * To return the integer arra
 *     - Store the size of th
 *     - Allocate the array s
 *
 * For example,
 * int* return_integer_array_
 *     *result_count = 5;
 *
 *     static int a[5] = {1,
 *
 *     return a;
```

240701072

```
 *     return a;
 * }
 *
 * int* return_integer_array_
 *     *result_count = 5;
 *
 *     int *a = malloc(5 * si
 *
 *     for (int i = 0; i < 5;
 *         *(a + i) = i + 1;
 *     }
 *
 *     return a;
 * }
 *
 */
int* reverseArray(int arr_cou
    *result_count=arr_count;
    for(int i=0;i<arr_count/2
    {
        int temp=arr[i];
        arr[i]=arr[arr_count-
        arr[arr_count-i-1]=te
    }
    return arr;
}
```

240701072

	Test

✓	`int arr[] = {1, 3, 2, 4, 5};`
	`int result_count;`
	`int* result = reverseArray(5, a`
	`for (int i = 0; i < result_cour`
	`printf("%d\n", *(result`

Question **2**

Correct

Marked out of 1.00

Flag question

An automated cutting machine is used to cut rods into segments. The cutting machine can only hold a rod of *minLength* or more, and it can only make one cut at a time. Given the array *lengths[]* representing the desired lengths of each segment, determine if it is possible to make the necessary cuts using this machine. The rod is marked into lengths already, in the order given.

Example

n = 3

lengths = [4, 3, 2]

minLength = 7

The rod is initially *sum(lengths) = 4 + 3 + 2 = 9* units long. First cut off the segment of length *4 + 3 = 7* leaving a rod *9 - 7 = 2*. Then check that the length *7* rod can be cut into segments of lengths *4* and *3*. Since *7* is greater than or equal to *minLength = 7*, the final cut can be made. Return *"Possible"*.

Example

n = 3

lengths = [4, 2, 3]

minLength = 7

The rod is initially *sum(lengths) = 4 + 2 + 3 = 9* units long. In this case, the initial cut can be of length *4* or *4 + 2 = 6*. Regardless of the length of the first cut, the remaining piece will be shorter than *minLength*. Because *n - 1 = 2* cuts cannot be made, the answer is

Function Description 240701072

Complete the function *cutThemAll* in the editor below.

cutThemAll has the following parameter(s):

int lengths[n]: the lengths of the segments, in order

int minLength: the minimum length the machine can accept

Returns

string: *"Possible"* if all *n-1* cuts can be made. Otherwise, return the string *"Impossible"*.

Constraints

- $2 \leq n \leq 10^5$
- $1 \leq t \leq 10^9$
- $1 \leq lengths[i] \leq 10^9$
- *The sum of the elements of lengths equals the uncut rod length.*

240701072

Input Format For Custom Testing

The first line contains an integer, *n*, the number of elements in *lengths*.

Each line *i* of the *n* subsequent lines (where *0 ≤ i < n*) contains an integer, *lengths[i]*.

The next line contains an integer, *minLength*, the minimum length accepted by the machine.

Sample Case 0

Sample Input For Custom Testing

STDIN Function

----- --------

4 → lengths[] size n = 4

3 → lengths[] = [3, 5, 4, 3]

5

4

3

9 → minLength= 9

Sample Output

240701072

Possible

Explanation

The uncut rod is *3 + 5 + 4 + 3 = 15* units long. Cut the rod into lengths of *3 + 5 + 4 = 12* and *3*. Then cut the *12* unit piece into lengths *3* and *5 + 4 = 9*. The remaining segment is *5 + 4 = 9* units and that is long enough to make the final cut.

Sample Case 1

Sample Input For Custom Testing

STDIN Function

----- --------

3 → lengths[] size n = 3

5 → lengths[] = [5, 6, 2]

6

2

12 → minLength= 12

Sample Output

240701072

Impossible

Explanation

The uncut rod is *5 + 6 + 2 = 13* units long. After making either cut, the rod will be too short to make the second cut.

Answer: (penalty regime: 0 %)

Reset answer

```
/*
 * Complete the 'cutThemAll'
 *
 * The function is expected t
 * The function accepts follo
 *  1. LONG_INTEGER_ARRAY ler
 *  2. LONG_INTEGER minLength
 */

/*
 * To return the string from
 *
 * For example,
 * char* return_string_using_
 *     static char s[] = "sta
 *
 *     return s;
```

```
 *
 * char* return_string_using_
 *     char* s = malloc(100 *
 *
 *     s = "dynamic allocatic
 *
 *     return s;
 * }
 *
 */
char* cutThemAll(int lengths_
long t=0,i=1;
for(int i=0;i<=lengths_count-
{
    t+=lengths[i];
}
do
{
    if(t-lengths[lengths_cour
    {
        return "Impossible";
    }
    i++;
}
while(i<lengths_count-1);
return "Possible";
}
```

240701072

	Test
✓	`long lengths[] = {3, 5, 4, 3};` `printf("%s", cutThemAll(4, leng`
✓	`long lengths[] = {5, 6, 2};` `printf("%s", cutThemAll(3, leng`
